"Mutation of a cysteine in the first transmembrane segment of Na,K-
ATPASe alpha subunit confers ouabain resistance.";
EMBO J. 11:1681-1687(1992).
-!- FUNCTION: THIS IS THE CATALYTIC COMPONENT OF THE ACTIVE ENZYME,
WHACH CATALYZES THE HYRROLYSIS OF ATP COUPLED WITH THE EXCRANGE OF
NA & K IONS ACROSS THE PLASMA MEMBRANE. THIS ACTION CREATES THE
ELECTROCHEMICAL GRADIENT OF NA, E, PROVIDING THE ENERGY FOR
ACTIVE TRANSPORT OF VARIOUS NUTRIENTS.
-!- CATALYTIC ACTIVITY: ATP + H(2)O + H(+)(IN) + NA(+)(OUT) = ADP +
PHOSPHATE + H(+)(OUT) + NA(+)(IN).
-!- SUBUNIT: COMPOSED OF THREE SUBUNITS: ALPHA (CATALYTIC), BETA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SODIUM/POTASSIUM-TRANSPORTING ATPASE ALPHA-1 CHAIN.

Sequence 4, Application US/08953326

Patent No. 6251872

GENERAL INFORMATION:
APPLICANT: Genta, Anthony F.
APPLICANT: McCulre, Travis C.
APPLICANT: McCulre, Travis C.
APPLICANT: Buridge, Michael J.
APPLICANT: Multa, Acceme
APPLICANT: Multa, Acceme
TITLE OF INVENTION: Nucleic Acid Vaccines Against Rickettsial Diseases of
TITLE OF INVENTION: Animals and Humans
TITLE OF INVENTION: Animals and Humans
FILE REFERENCE: UF-1670.
CURRENT APPLICATION NUMBER: US/08/953,326

CURRENT FILING DATE: 1997-10-17

EARLIER RELIGATION NUMBER: 08/733,230

EARLIER PLING DATE: 1997-10-17

SEALLIER PLING DATE: 1997-10-17

The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafensis and E. canis. The E. chafensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to 2) shown in AAY06943-958. The E. canis proteins form part of the P30 family and
                                                                                                    This is the full-length variable surface antigen VSA3 protein of Bhrlichia chaffeensis. Its amino acid sequence was deduced from a partial open reading frame (ORF5) of a genomic locus (see AAV07179) of E. chaffeensis that was obtained on the basis of homology to the major antigenic protein MAPI (see AAM51088) of Cowdria runninantium. This genomic locus included 5 ORFs encoding similar, but non-identical proteins (see AAM51091-95). A claimed composition comprises a nucleic acid (see AAV107176-82) encoding a polypeptide (see AAM51088-99) that elicits a protective immune response against ricketrial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia, but and Cowdria species. The Ehrlichia antigenic polypeptides can be used diagnostically to detect antibodies associated with Ehrlichia infection (claimed).
             Composition containing nucleic acid encoding rickettsial antigen - useful for, e.g. stimulating protective immune response in humans or

The present sequence shows a high degree of similarity to the major antigenic protein 1 (MAPI) of Ehrlichia sp. The MAPI gene may be used in a vaccines to protect animals or humans against rickettsial diseases caused by a organisms of Rickettsial sp., Ehrlichia sp., Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HCMV) enhancer-promoter. Cowdria ruminatium genes designated map 2, Ihworff, 4hworff, 18hworfl and 3gdorff may be used in therapeutic and diagnostic applications. The polypeptides are useful for detecting antibodies associated with used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria runinantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                TC;
consist of proteins shown in AAY06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.

The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeensis and E. canis. The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAY06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAY06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                            Outer membrane protein; OMP; Ehrlichia chafeensis; E. canis; P30;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence represents the amino acid sequence of variable surface antigen 3 (VSA3) isolated from Ehrlichia chaffeensis, which has similarity to major antigen protein (MAP). The MAP polynucleotides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial research where identification of particular organisms or strains is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, or

The present sequence shows a high degree of similarity to the major antigenic protein 1 (MAP1) of Ehrlichia sp. The MAP1 gene may be used in a vaccines to protect animals or humans against rickettsial diseases caused by a organisms of Rickettsia sp., Ehrlichia sp., Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HCMV) enhancer promoter. Cowdria ruminatium genes designated map 2, Ihworf3, Ahworf1, 18hworf1 and 3gdorf3 may be used in therapeutic and diagnostic applications. The polypeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polynucleotides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens

                                                                                                                                                                                                                                                                                                                                                                                                                          This is the full-length variable surface antigen VSA4 protein of Ehrlichia chaffeensis. Its amino acid sequence was deduced from a partial open reading frame (ORF4) of a genomic locus (see AAV07179) of E. chaffeensis that was obtained on the basis of homology to the major antigenic protein MAPI (see AAM51088) of Cowdria ruminantium. This genomic locus included 5 ORF8 encoding similar, but non-identical protein (see AAM51091-95). A claimed composition comprises a nucleic acid (see AAW51076-82) encoding a polypeptide (see AAW5108-95). The number response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia, brilichia, Anaplasma and Cowdria species. The Ehrlichia antigenic associated with Ehrlichia infection (claimed).

The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeensis and E. canis. The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAY06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAY06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Outer membrane protein; OMP; Ehrlichia chafeensis; E. canis; P30;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 qq
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                              The sequence represents the amino acid sequence of variable surface antigen 4 (VSA4) isolated from Ehrlichia chaffeensis, which has similarity to major antigen protein (MAP). The MAP polynucleotides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial research where identification of particular organisms or strains is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeensis and E. canis. The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in ARV06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in ARV06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          membrane protein; OMP; Ehrlichia chafeensis; E. canis; P30;

This is the near full-length variable surface antigen VSAS protein
of Ehrlichia chaffeensis; it lacks about 5-7 C-terminal amino acid
cresidues. The VSAS amino acid sequence was deduced from a partial
cresidues. The VSAS amino acid sequence was deduced from a partial
central state as obtained on the basis of homology to the major
antigenic protein MAPI (see AAN$1088) of Cowdria ruminantium. This
genomic locus included 5 ORFs encoding similar, but non-identical
proteins (see AAN$1091-95). A claimed composition comprises a
cucleic acid (see AAN$1076-82) encoding a polypeptide (see AAN$1088-99)
that elicits a protective immune response against a rickettsial
pathogen. The nucleic acid is used, in human or veterinary
medicine, in vaccines to protect against Rickettsia. Ehrlichia,
chaptagen and Cowdria species. The Bhrlichia antigenic
polypeptides can be used diagnostically to detect antibodies
ssociated with Ehrlichia infection (claimed).
                                                                                                   Composition containing nucleic acid encoding rickettsial antigen useful for, e.g. stimulating protective immune response in humans or

                                                                                                                                                                                                                                                                                                                                        The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeensis and E. canis. The E. Chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAYO6943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAYO6959-97O. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.

                                                                                                                                                                                                                 The present sequence shows a high degree of similarity to the major antigenic protein 1 (MAR1) of Ehrlichia sp. The MAP1 gene may be used in a vaccines to protect animals or humans against rickettsial diseases caused by a organisms of Rickettsia sp., Ehrlichia sp., Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HCWV) enhancer-promoter. Cowdria ruminatium genes designated map 2, Ihworf3, 4hworf1, 18hworf1 and 3gdorf3 may be used in therapeutic and diagnostic applications. The polypeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polynucleotides may be used to detect the presence of rickettsial nucleic acids.
                                              New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         heartwater, or

has similarity to major antigen protein (MAP). The MAP polynucleotides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial research where identification of particular organisms or strains is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This polypeptide comprises the major antigen protein 1 gene (MAP1) of Ehrlichia chaffeensis. It is encoded by the MAP1 gene (see AAV07177). A claimed composition comprises a nucleic acid (see protective immune response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia, Ehrlichia, Anaplasma and Cowdia species. The nucleic acid does not replicate in the host but remains episomal and capable of expressing polypeptide for at least 19 mth. The Ehrlichia antigenic polypeptides can be used aingnostically to detect antibodies associated with Ehrlichia infection (claimed).
                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Composition containing nucleic acid encoding rickettsial antigen useful for, e.g. stimulating protective immune response in humans or

Sequence 4, Application US/08304309
Patent No. 5854544
SENERAL INFORMATION:
APPLICANT: GONZALEZ_FIRE J.
APPLICANT: FERNANDEZ_SALGUERO, PEDRO
TITLE OF INVENTION: DIMYDROPRIMIDINE DEHYDROGENASE
NUMBER OF SEQUENCES: 1
STATE: California
COUNTRY: San Francisco
STRREY: San Francisco
COUNTRY: US
STATE: California
COUNTRY: US
STATE: California
COMPUTER READABLE PORM:
MEDIUM TYPE: IBPP C compatible
OPERATING SYSTEM: PC compatible
OPERATING SYSTEM: PC compatible
OPERATING SYSTEM: DS/080/304,309
FILING DATE: US/08/204,309
FILING DATE: US/08-1994
CLASSIFICATION NUMBER: 15280-210
FREISTRATION NUMBER: 15280-210
FREISCAMTUNICATION INFORMATION:
NAME: Smith, Timothy L.

          The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafebasis and E. canis. The E. chafebasis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAY06943-958. The E. canis proteins form part of the P30 family and consist of proteins form part of the P30 family and consist of proteins and genes are used to detect E. chafeensls in patients and E. canis in dogs.
                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This is the full-length variable surface antigen VSA4 protein of Ehrlichia chaffeensis. Its amino acid sequence was deduced from a partial open reading frame (ORF4) of a genomic locus (see AAV07179) of E. chaffeensis that was obtained on the basis of homology to the major antigenic protein MAPI (see AAW18088) of Cowdria ruminantium. This genomic locus included 5 ORFs encoding similar, but non-identical proteins (see AAW19091-95). A claimed composition comprises a nucleic acid (see AAW1091-95). A claimed composition (see AAW51088-99) that elicits a protective immune response against rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia, bhilichia, Anaplasma and Cowdria species. The Ehrlichia antigenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Composition containing nucleic acid encoding rickettsial antigen - useful for, e.g. stimulating protective immune response in humans or

The present sequence shows a high degree of similarity to the major antigonic protein 1 (MAP1) of Enritchia sp. The MAP1 gene may be used in a vaccines to protect animals or humans against rickettsial diseases caused by a organisms of Rickettsia sp., Ehrlichia sp., Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HGWV) enhancer-promoter. Cowdria ruminatium genes designated map 2, Ihworf9, 4hworf1, 18hworf1 and 3gdorf3 may be used in therapeutic and diagnostic applications. The polypeptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whilst the polynucleotides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens

The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeensis and E. canis. The E. chaffeensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to Z) shown in AAY06943-958. The E. canis proteins form part of the P30 family and consist of proteins shown in AAY06959-970. The proteins and genes are used to detect E. chaffeensis in patients and E. canis in dogs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Outer membrane protein; OMP; Ehrlichia chafeensis; E. canis; P30;

The MAP polynucleotides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial research where identification of particular organisms or strains is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, or as molecular markers in nucleic acid analysis procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

                                                                                                                                                                                                                                                    The invention provides isolated outer membrane proteins (OMP) from Ehrlichia chafeneiss and E. canis. The E. chafecensis proteins form part of the OMP family and consist of proteins OMP-1, -1(B to 2) shown in AAVG643-95B. The E. canis proteins Grom part of the P30 family and consist of proteins shown in AAVG6559-970. The proteins and genes are used to detect E. chafeensis in patients and E. canis in dogs.

This is the near full-length variable surface antigen VSA5 protein of Ehrlichia chaffeensis; it lacks about 5-7 cterminal amino acid residues. The VSA5 amino acid sequence was deduced from a partial open reading frame (ORF5) of a genomic locus (see AAV07179) of E. chaffeensis that was obtained on the basis of homology to the major antigenic protein MAPI (see AAM51088) of Cowdria ruminantium. This genomic locus included 5 ORFs encoding similar, but non-identical nucleic acid (see AAW51091-95). A claimed composition comprises a nucleic acid (see AAW51092) encoding a polypeptide (see AAW51088-99) pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Rickettsia, Ehrlichia, Anaplasma and Cowdria species. The Ehrlichia antigenic polypeptides can be used diagnostically to detect antibodies associated with Ehrlichia infection (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polynucleotides useful as DNA vaccines for conferring immunity to rickettsial infection e.g. heartwater caused by Cowdria ruminantium, comprises major antigenic protein 1 or 2 gene of rickettsial pathogens
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Ganta RR, Burridge MJ, Mahan SM, McGuire TC; Id AL, Simbi BH, Whitmire WW, Alleman AR;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        nucleic acid
Anaplasma sp. or Cowdria sp. The vaccine elicits an immune response protective against the rickettsial pathogen. The nucleic acid vaccines can be driven by the human cytomegalovirus (HCMV) enhancer-promoter. Cowdria ruminatium genes designated map 2. Ihworf3, 4hworf1, 18hworf1 and 3gdorf3 may be used in therapeutic and diagnostic applications. The polypoptides are useful for detecting antibodies associated with infection by a rickettsial pathogen whist the polymucleotides may be used to detect the presence of rickettsial nucleic acids.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence represents the amino acid sequence of variable surface antigen 5 (VSA5) isolated from Ehrlichia chaffeensis, which has shimilarity to major antigen protein (MAP). The MAP polynucleotides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, or as molecular markers in nucleic acid analysis procedures
                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This polypeptide comprises the major antigen protein 1 gene (MAP1) of Ehrlichia chaffeensis. It is encoded by the MAP1 gene (see AAV07177). A claimed composition comprises a nucleic acid (see PANV07176-82) encoding a polypeptide (see AAW51088-99) that elicits a protective immune response against a rickettsial pathogen. The nucleic acid is used, in human or veterinary medicine, in vaccines to protect against Ricketsia, Ehrlichia, Anaplasma and Cowdria species. The nucleic acid does not replicate in the host but remains episomal and capable of expressing polypeptide for at least 19 mth. The Ehrlichia antigenic polypeptides can be used diagnostically to detect antibodies associated with Ehrlichia

The sequence represents the amino acid sequence of major antigenic protein! (MAPI) from Ehrlichia chaffeensis. The MAP polynucleotides and polypeptides are useful as vaccines for conferring immunity to rickettsia infection, including Cowdria ruminantium causing heartwater. The MAP polynucleotides may be used as molecular markers in nucleic acid analysis procedures, and to produce the MAP polypeptides, which may be used to raise antibodies that are reactive with the polypeptides. The nucleic acids may further be used as probes to identify complementary sequences within other nucleic acid molecules or genomes, where such probes can be applied to identify or distinguish infectious strains of organisms in diagnostic procedures or in rickettsial research where identification of particular organisms or strains is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New MAP2 genes and polypeptides useful as vaccines for conferring immunity to human and animal rickettsial diseases, e.g. heartwater, as molecular markers in nucleic acid analysis procedures
